This notebook introduces basic tensor operations in PyTorch as part of Assignment 1.

Install PyTorch

To run this notebook, ensure you have PyTorch installed. If not, install it using (The installation could take 5 minutes or more):

In [ ]:

```
# The following command installs the PyTorch library, which is essential for tensor operations and deep learning tasks.
# If you already have PyTorch installed, you can skip this step.
#pip install torch
# --> Se instaló en el entorno virtual de Python.
```

Import PyTorch

In [6]:

```
# Import the PyTorch library.
# PyTorch provides powerful tools for tensor computation and deep learning.

import torch
```

Creating a Tensor

In [8]:

```
# Creating a simple tensor using PyTorch.
# A tensor is a multi-dimensional array, similar to a NumPy array, and is the basic data structure in PyTorch.
# Create a 1D tensor with values 1 to 5.
tensor = torch.tensor([1, 2, 3, 4, 5])
# Print the tensor to verify its contents.
print(tensor)
```

Out [8]:

```
tensor([1, 2, 3, 4, 5])
```
